## Class 17-19: Reliable Data Transfer

Khaled Mahmud Shahriar  
Assistant Professor, Dept. of CSE, BUET  
[khaledshahriar@cse.buet.ac.bd](mailto:khaledshahriar@cse.buet.ac.bd)

# Chapter 3

## Transport Layer

### A note on the use of these ppt slides:

We're making these slides freely available to all (faculty, students, readers). They're in PowerPoint form so you see the animations; and can add, modify, and delete slides (including this one) and slide content to suit your needs. They obviously represent a *lot* of work on our part. In return for use, we only ask the following:

- ❖ If you use these slides (e.g., in a class) that you mention their source (after all, we'd like people to use our book!)
- ❖ If you post any slides on a www site, that you note that they are adapted from (or perhaps identical to) our slides, and note our copyright of this material.

Thanks and enjoy! JFK/KWR

## Computer Networking: A Top Down Approach

6<sup>th</sup> edition

Jim Kurose, Keith Ross  
Addison-Wesley  
March 2012

# Chapter 3 outline

3.1 transport-layer services

3.2 multiplexing and demultiplexing

3.3 connectionless transport: UDP

3.4 principles of reliable data transfer

3.5 connection-oriented transport: TCP

- segment structure
- reliable data transfer
- flow control
- connection management

3.6 principles of congestion control

3.7 TCP congestion control

# Principles of reliable data transfer

- ❖ important in application, **transport**, **link** layers
  - top-10 list of important networking topics!

(a) provided service

- ❖ characteristics of unreliable channel will determine complexity of reliable data transfer protocol (rdt)

# Principles of reliable data transfer

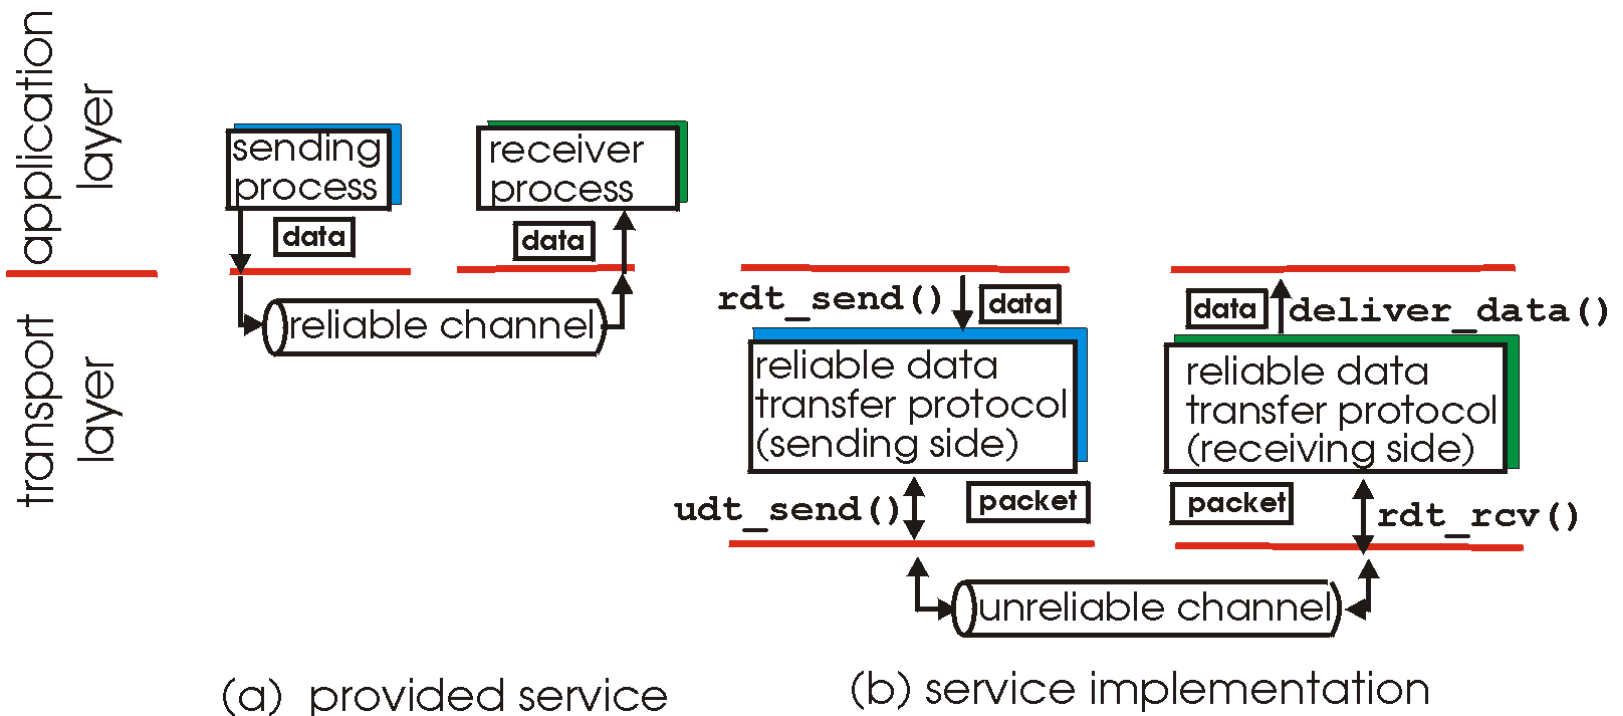

- ❖ important in application, transport, link layers
  - top-10 list of important networking topics!

- ❖ characteristics of unreliable channel will determine complexity of reliable data transfer protocol (rdt)

# Principles of reliable data transfer

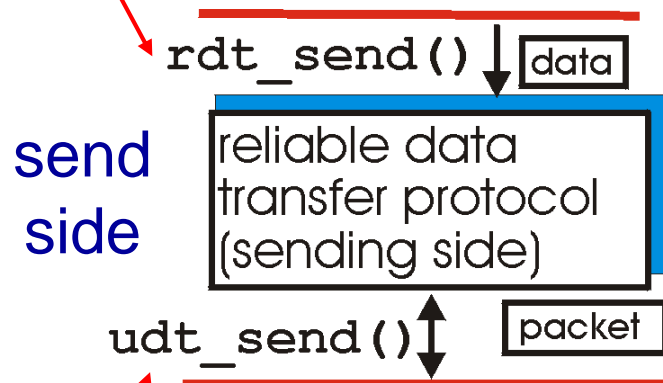

- ❖ important in application, transport, link layers
  - top-10 list of important networking topics!

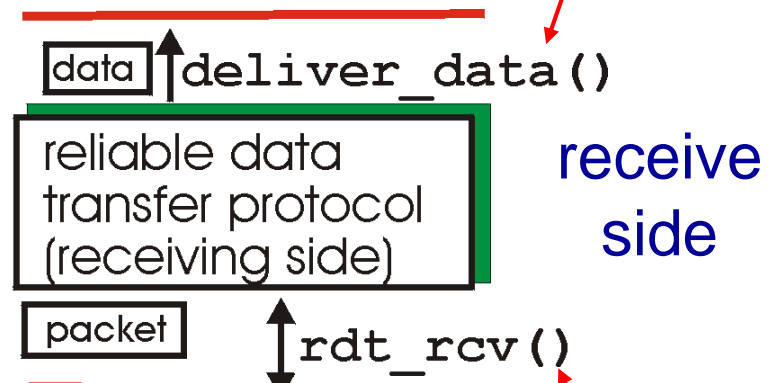

- ❖ characteristics of unreliable channel will determine complexity of reliable data transfer protocol (rdt)

# Reliable data transfer: getting started

**rdt\_send()** : called from above,  
(e.g., by app.). Passed data to  
deliver to receiver upper layer

**deliver\_data()** : called by  
**rdt** to deliver data to upper

**udt\_send()** : called by rdt,  
to transfer packet over  
unreliable channel to receiver

**rdt\_rcv()** : called when packet  
arrives on rcv-side of channel

# Characteristics of Channel

- ❖ Packet may get corrupted due to noise, device error etc. but always reaches the receiver
- ❖ Packets may get lost in transit
- ❖ Packets may be reordered
  - problem of delayed duplicate

# Reliable data transfer: getting started

we' ll:

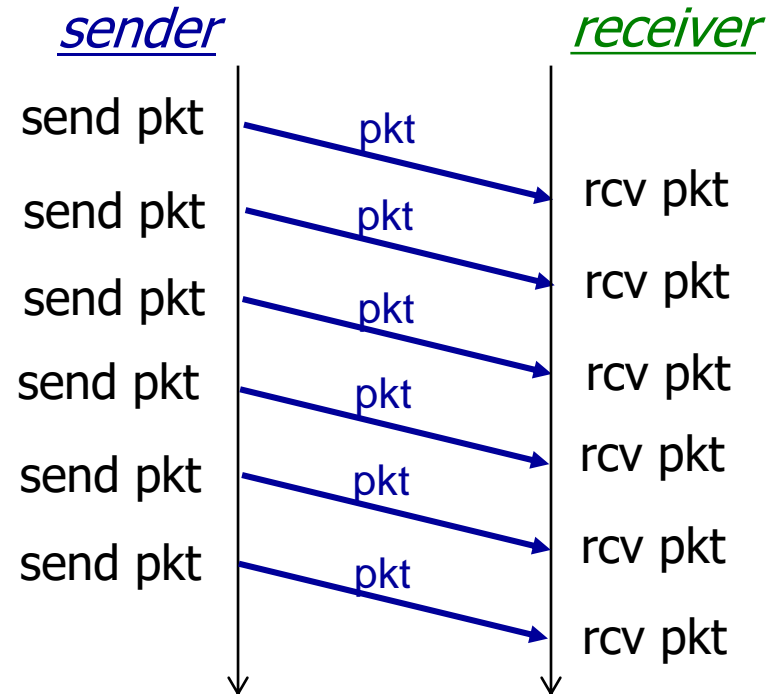

- ❖ incrementally develop sender, receiver sides of reliable data transfer protocol (rdt)
- ❖ consider only unidirectional data transfer
  - but control info will flow on both directions!
- ❖ use finite state machines (FSM) to specify sender, receiver

**state:** when in this “state” next state uniquely determined by next event

# rdt1.0: reliable transfer over a reliable channel

- ❖ underlying channel perfectly reliable
  - no bit errors
  - no loss of packets
- ❖ separate FSMs for sender, receiver:
  - sender sends data into underlying channel
  - receiver reads data from underlying channel

sender

receiver

# rdt2.0: channel with bit errors

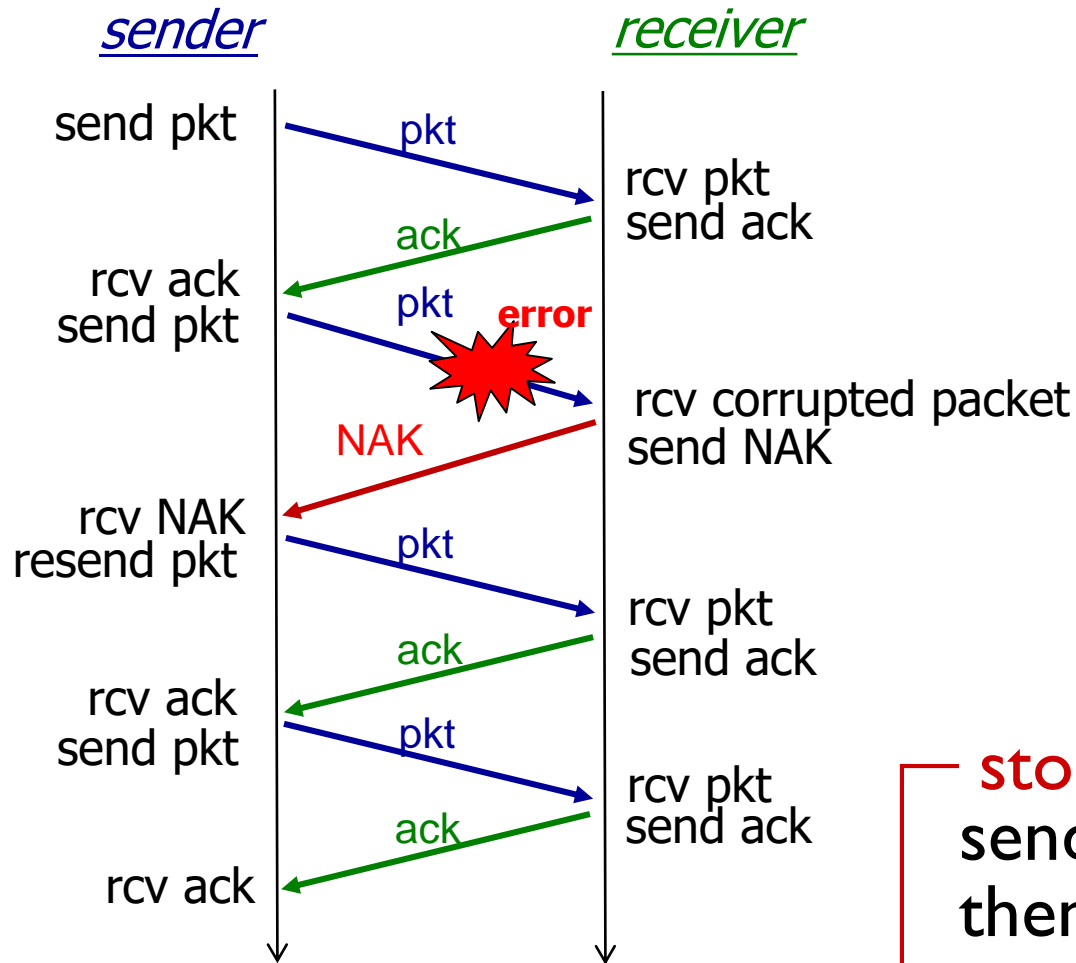

- ❖ underlying channel may flip bits in packet
  - checksum to detect bit errors
- ❖ *the question: how to recover from errors:*

*How do humans recover from “errors”  
during conversation?*

# rdt2.0: channel with bit errors

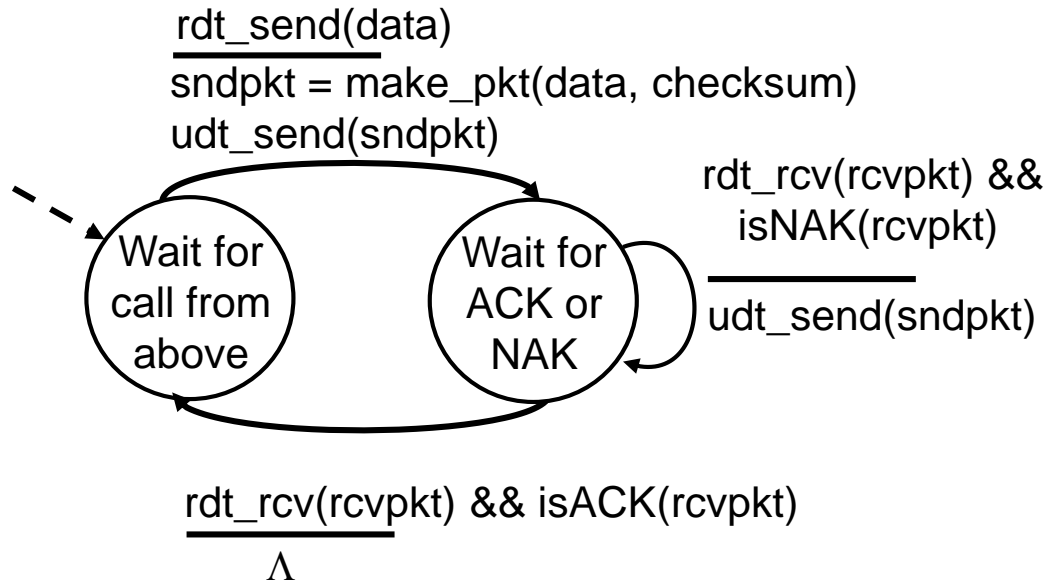

- ❖ underlying channel may flip bits in packet
  - checksum to detect bit errors
- ❖ *the question: how to recover from errors:*
  - *acknowledgements (ACKs)*: receiver explicitly tells sender that pkt received OK
  - *negative acknowledgements (NAKs)*: receiver explicitly tells sender that pkt had errors
  - sender retransmits pkt on receipt of NAK
- ❖ new mechanisms in `rdt2.0` (beyond `rdt1.0`):
  - error detection
  - feedback: control msgs (ACK,NAK) from receiver to sender

# rdt2.0 in action space-time diagram

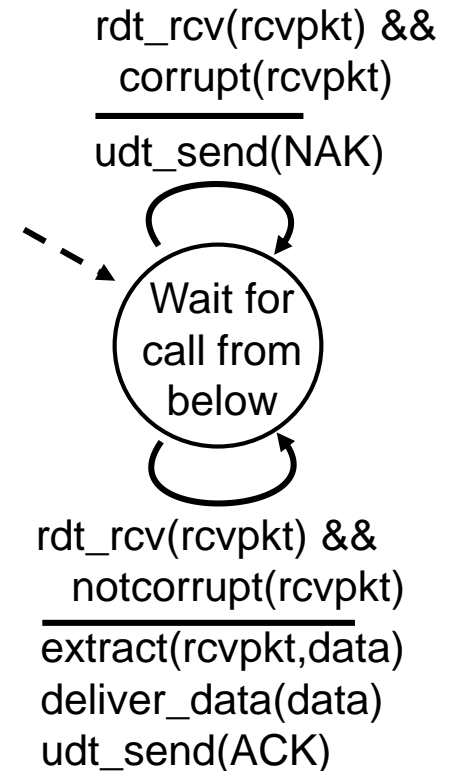

**stop and wait**  
sender sends one packet,  
then waits for receiver  
response

# rdt2.0: FSM specification

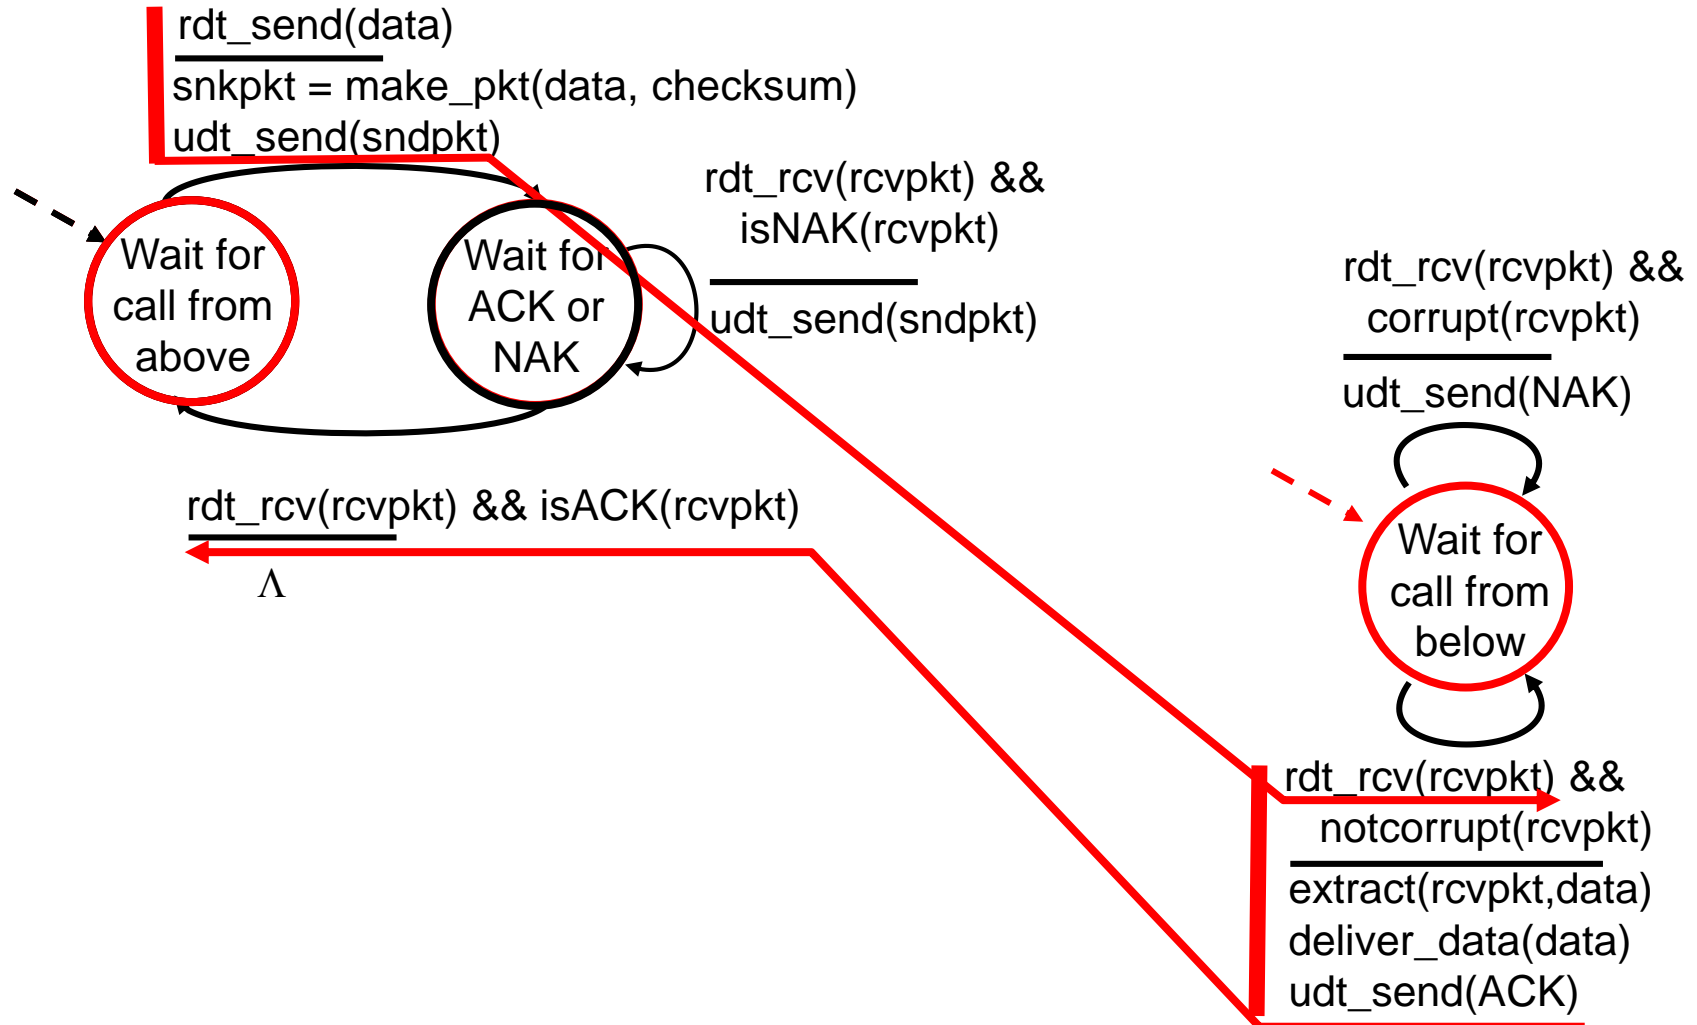

sender

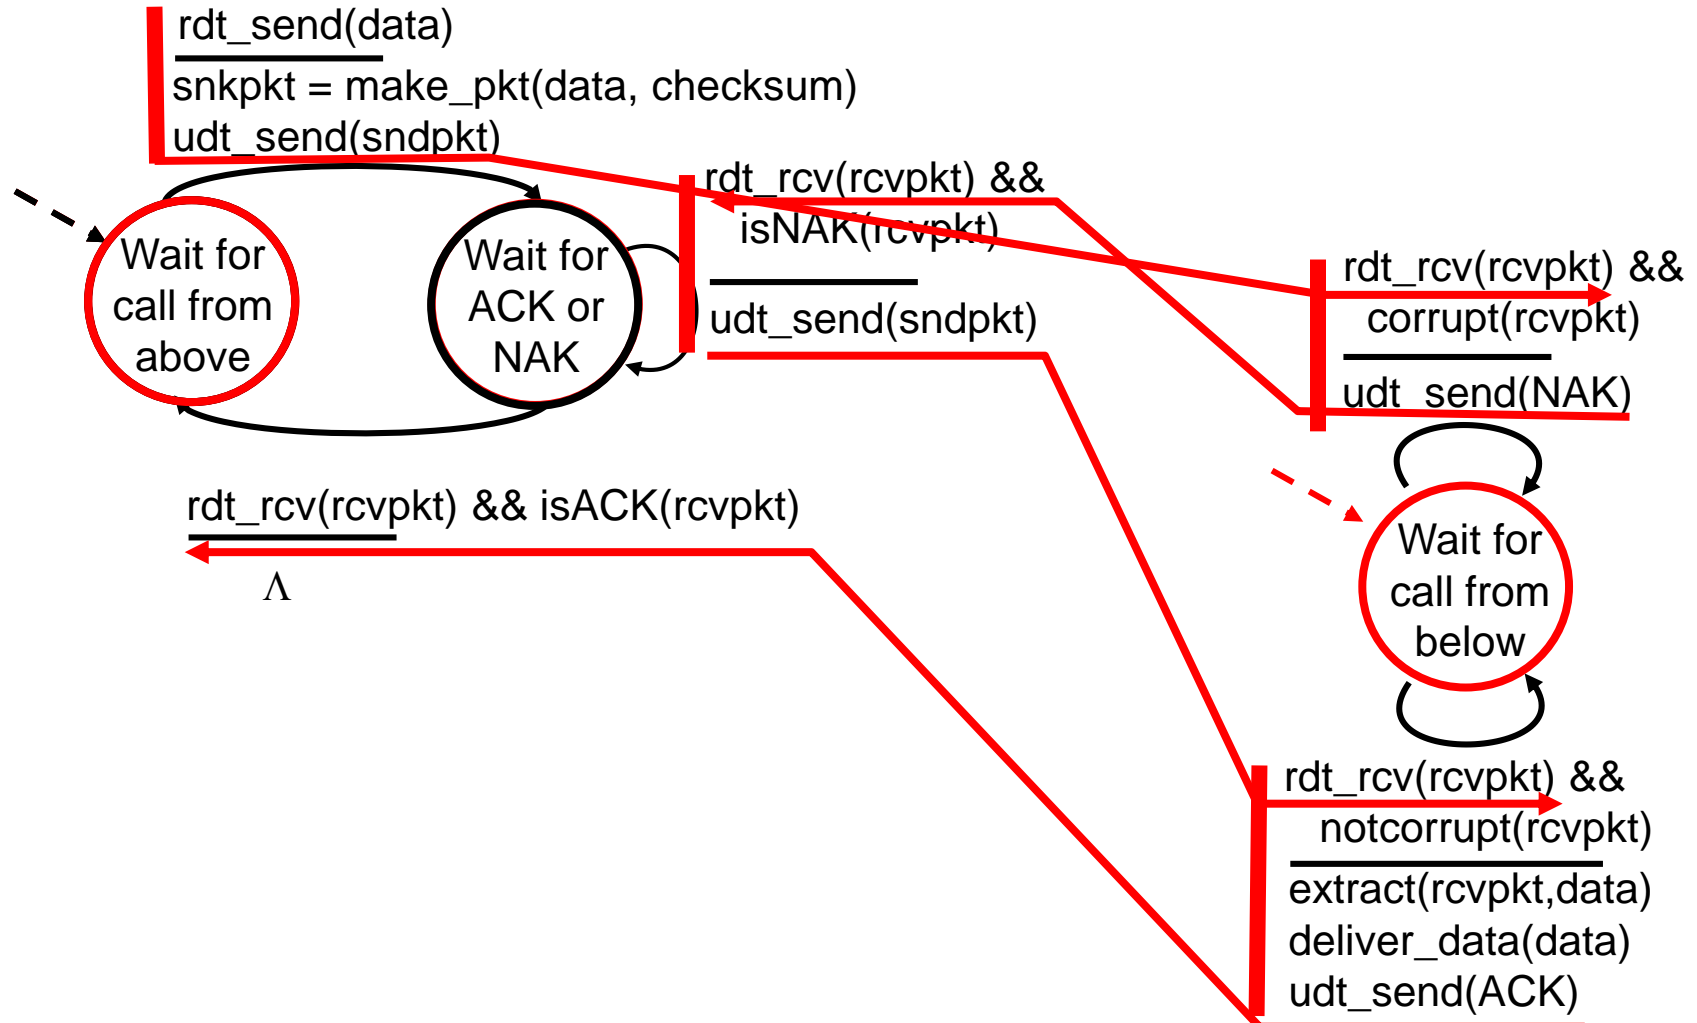

receiver

# rdt2.0: operation with no errors

# rdt2.0: error scenario

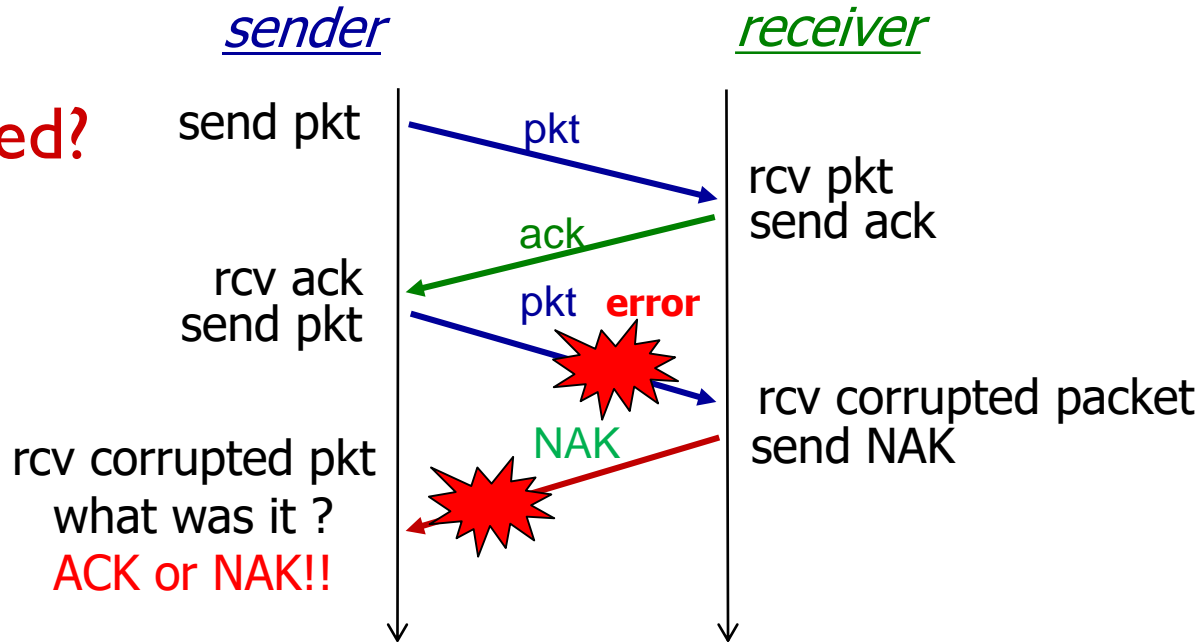

# rdt2.0 has a fatal flaw!

what happens if  
**ACK/NAK corrupted?**

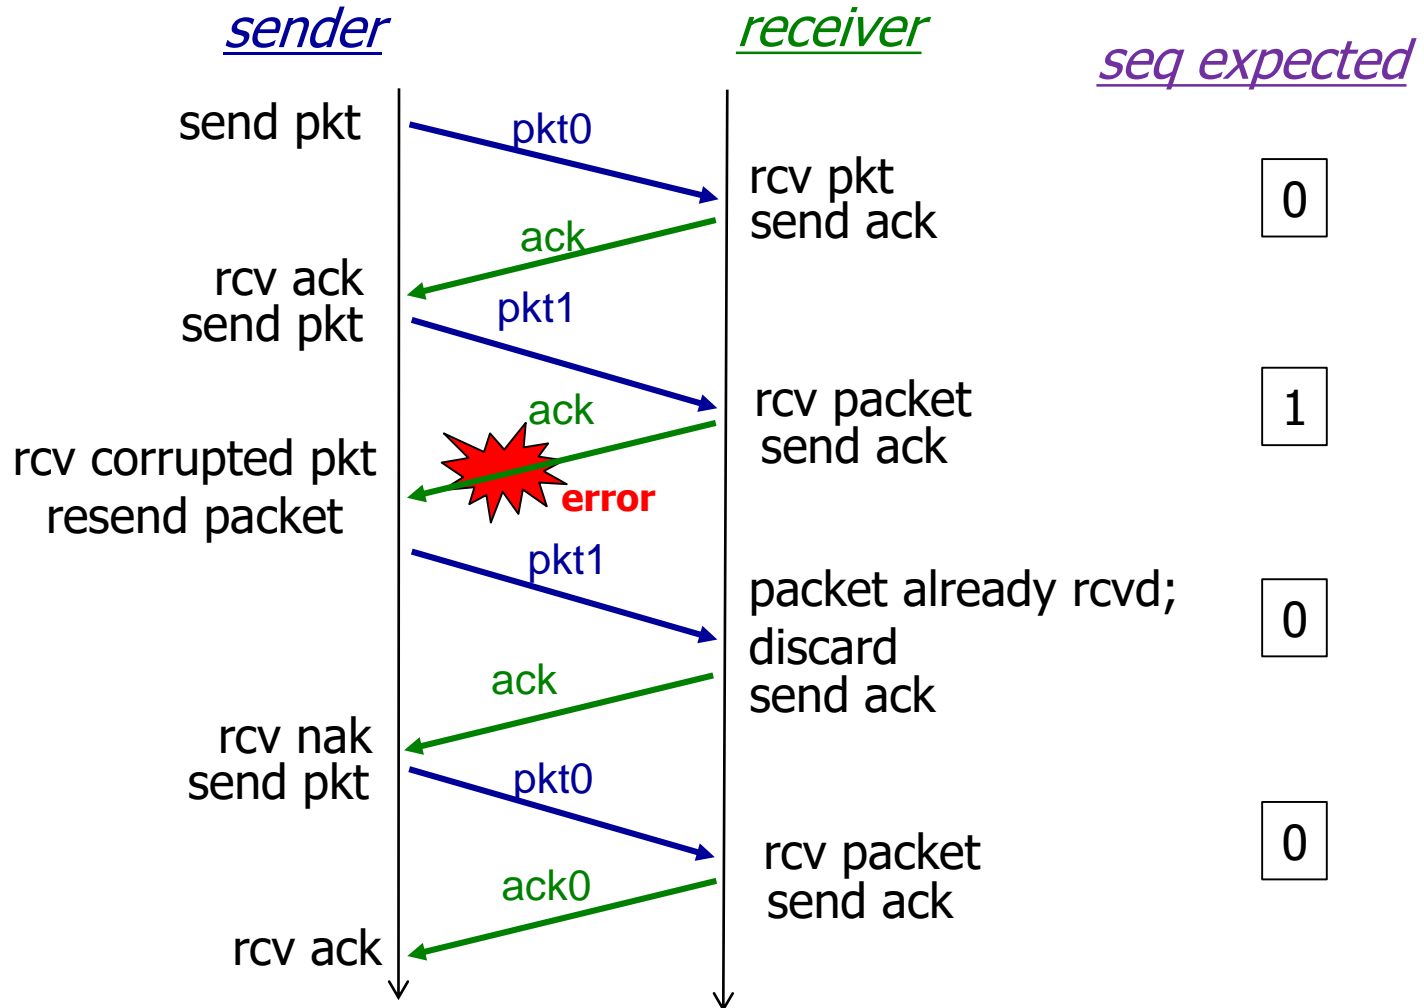

- ❖ sender doesn't know what happened at receiver!
- ❖ can't just retransmit: possible duplicate

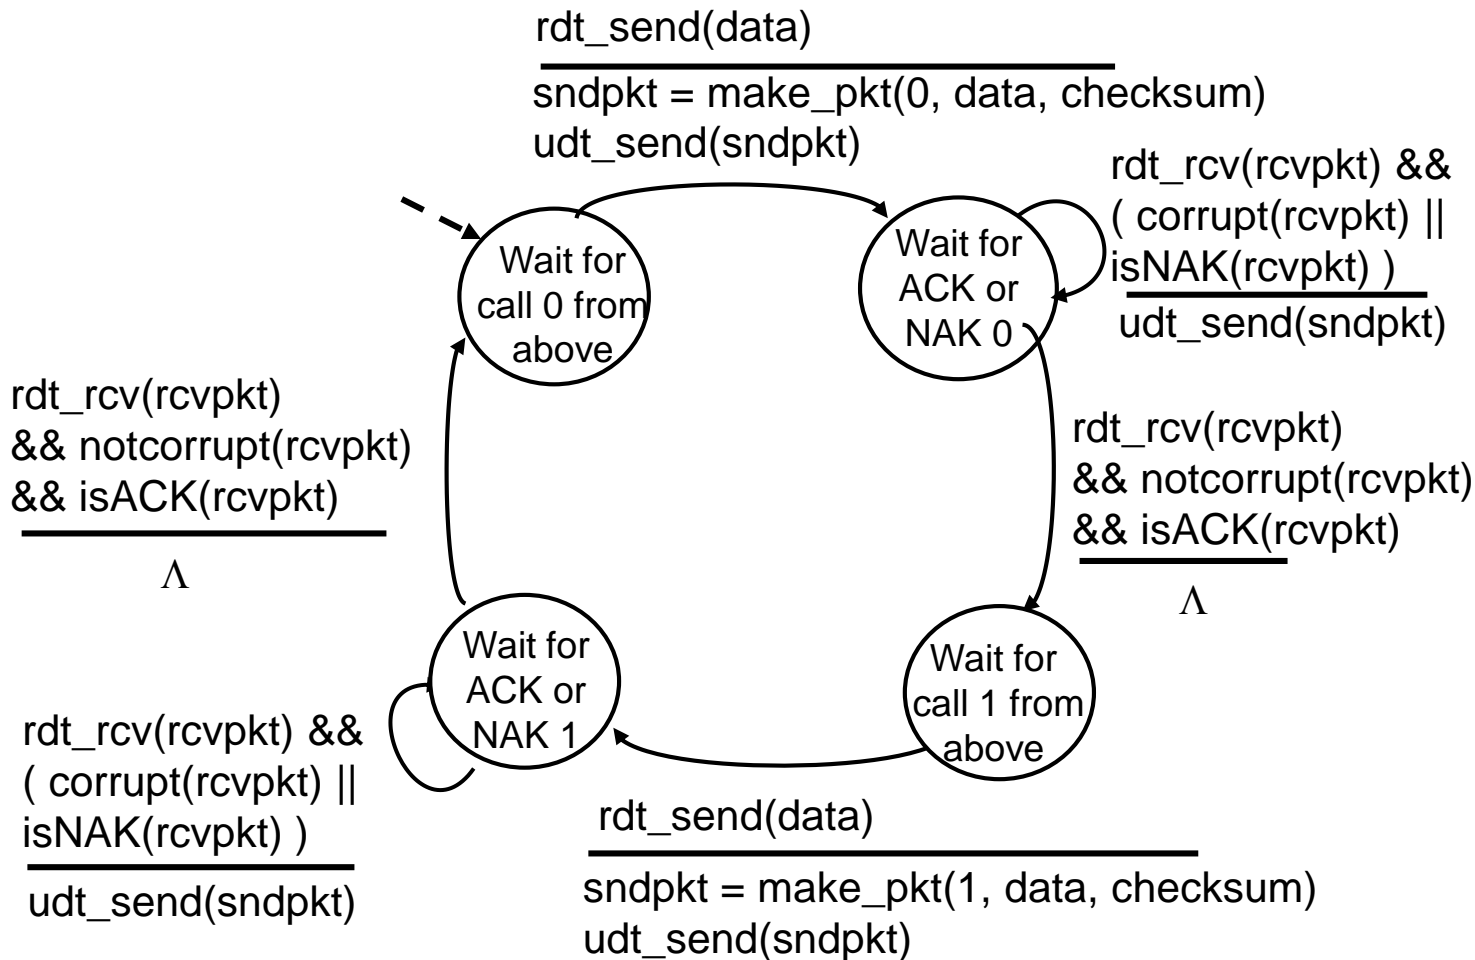

## handling duplicates:

- ❖ sender retransmits current pkt if ACK/NAK corrupted
- ❖ sender adds *sequence number* to each pkt
- ❖ receiver discards (doesn't deliver up) duplicate pkt

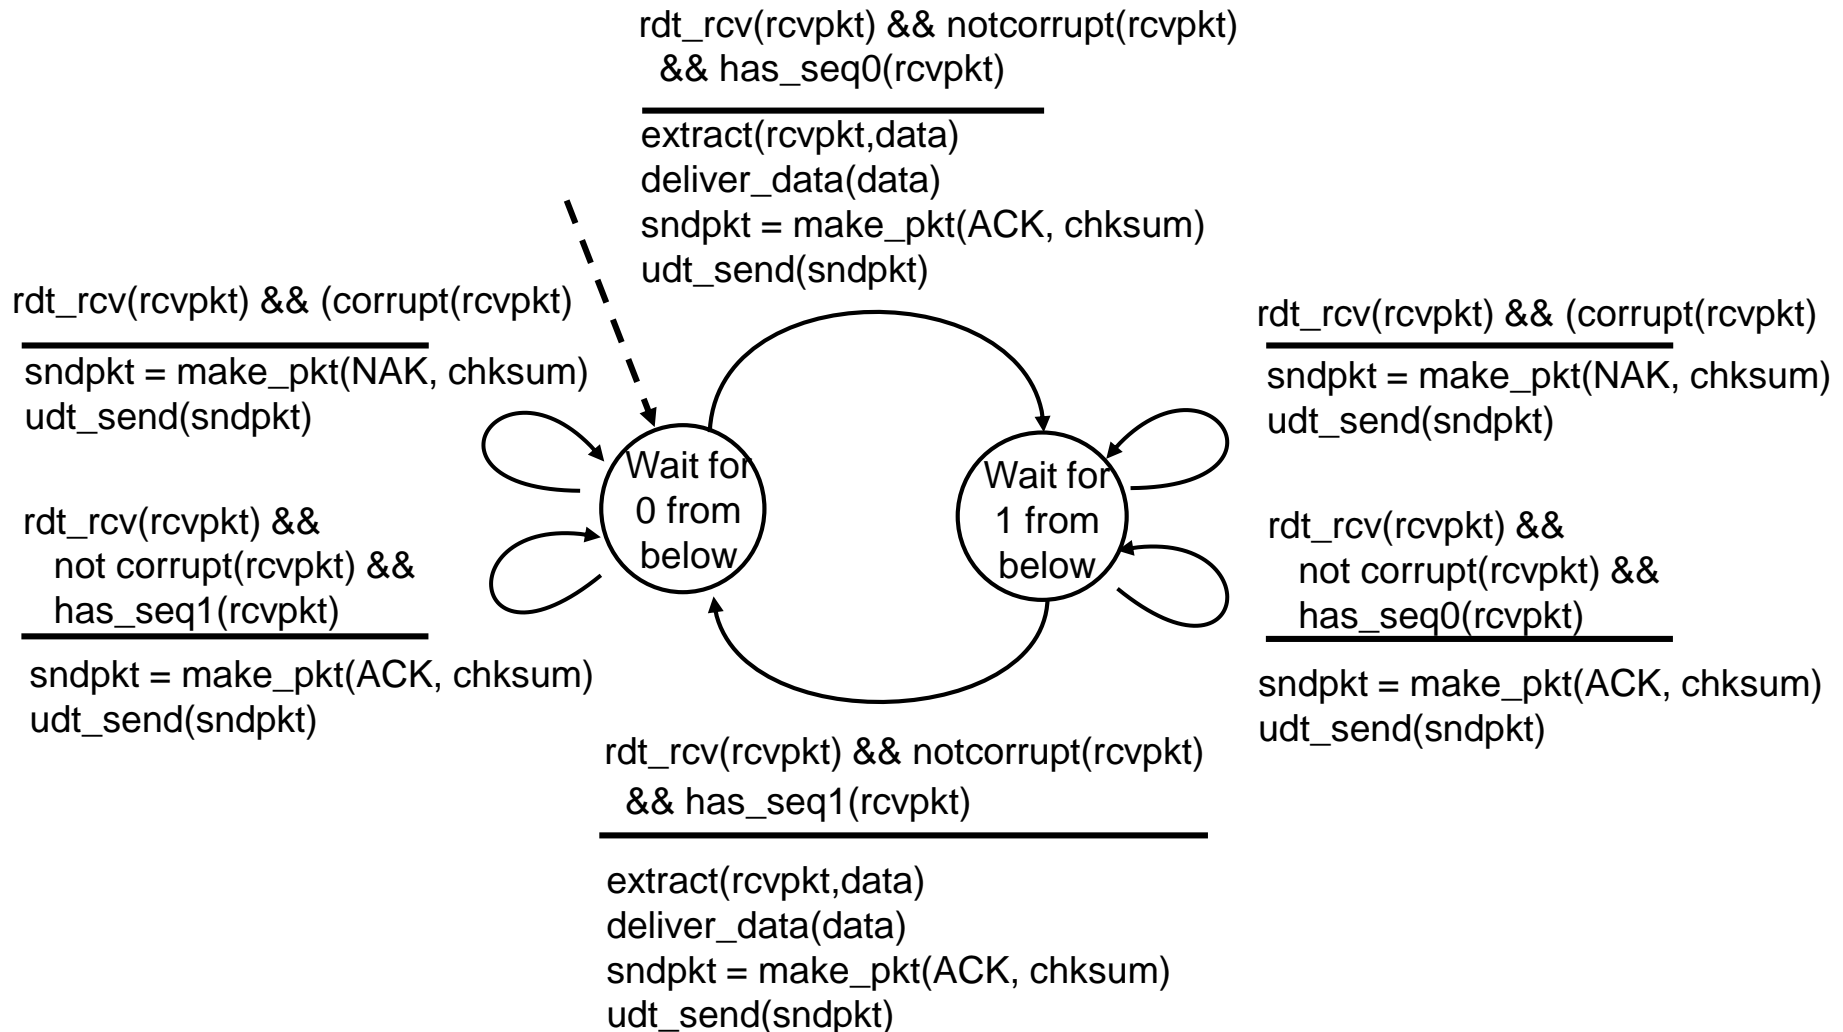

# rdt2.1: Frames with Seq No.

# rdt2.1: sender, handles garbled ACK/NAKs

# rdt2.1: receiver, handles garbled ACK/NAKs

# rdt2.1: discussion

## sender:

- ❖ seq # added to pkt
- ❖ two seq. #'s (0,1) will suffice. Why?
- ❖ must check if received ACK/NAK corrupted
- ❖ twice as many states
  - state must “remember” whether “expected” pkt should have seq # of 0 or 1

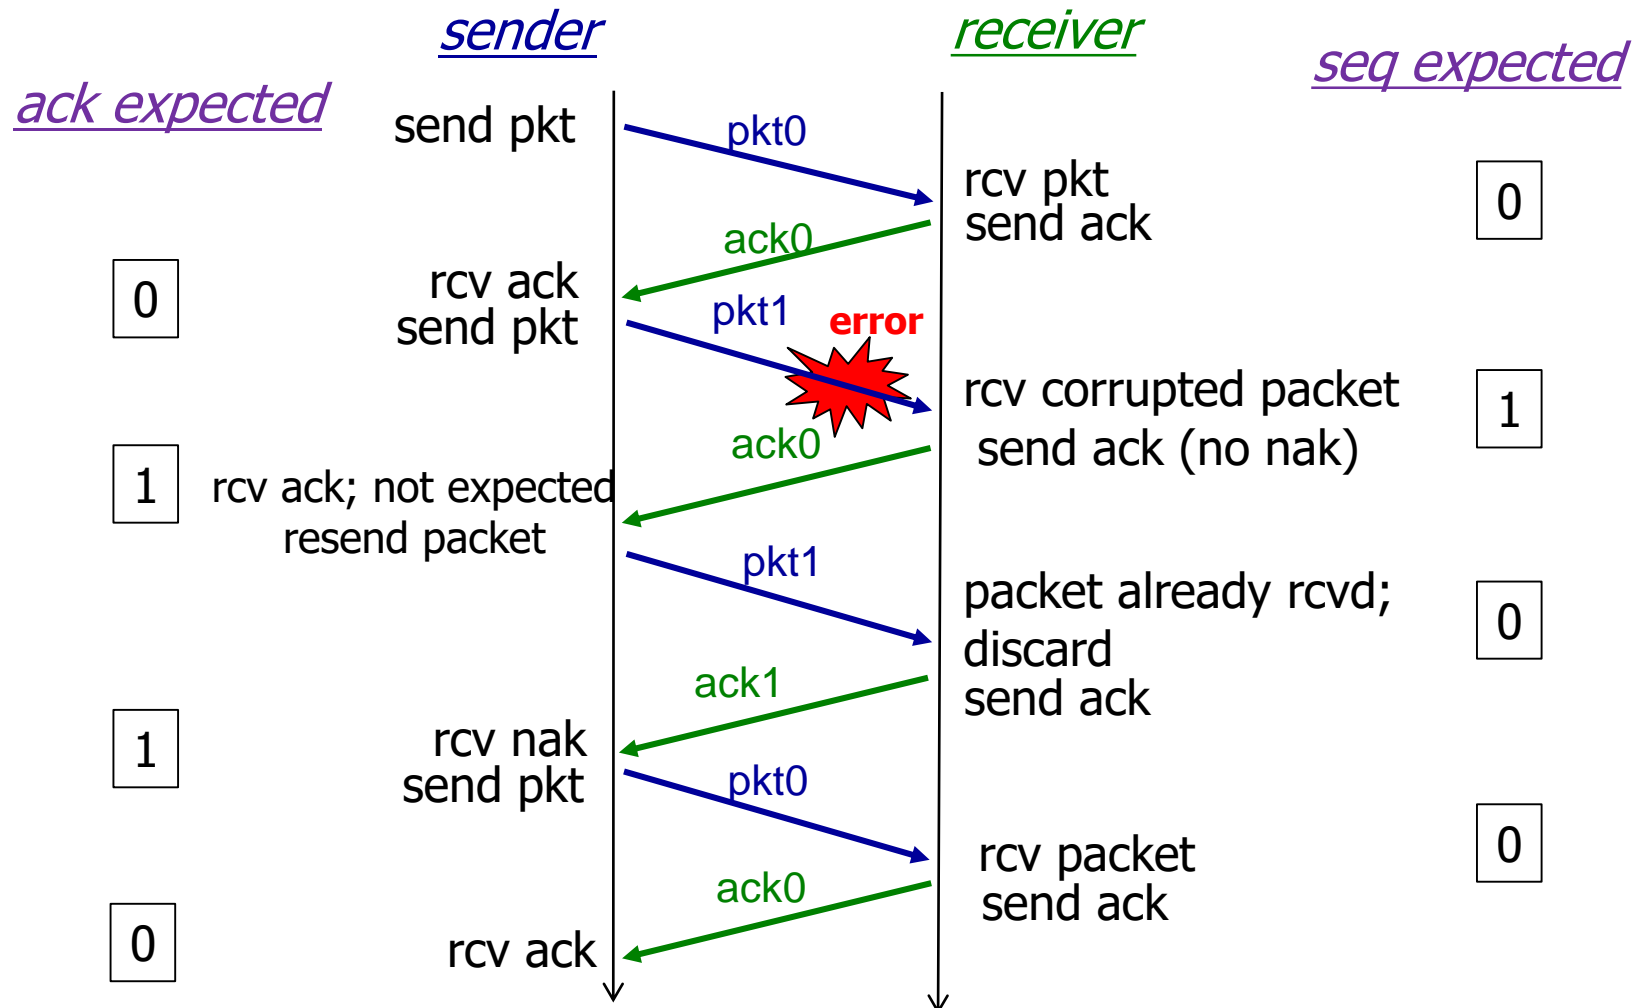

## receiver:

- ❖ must check if received packet is duplicate
  - state indicates whether 0 or 1 is expected pkt seq #
- ❖ note: receiver can *not* know if its last ACK/NAK received OK at sender

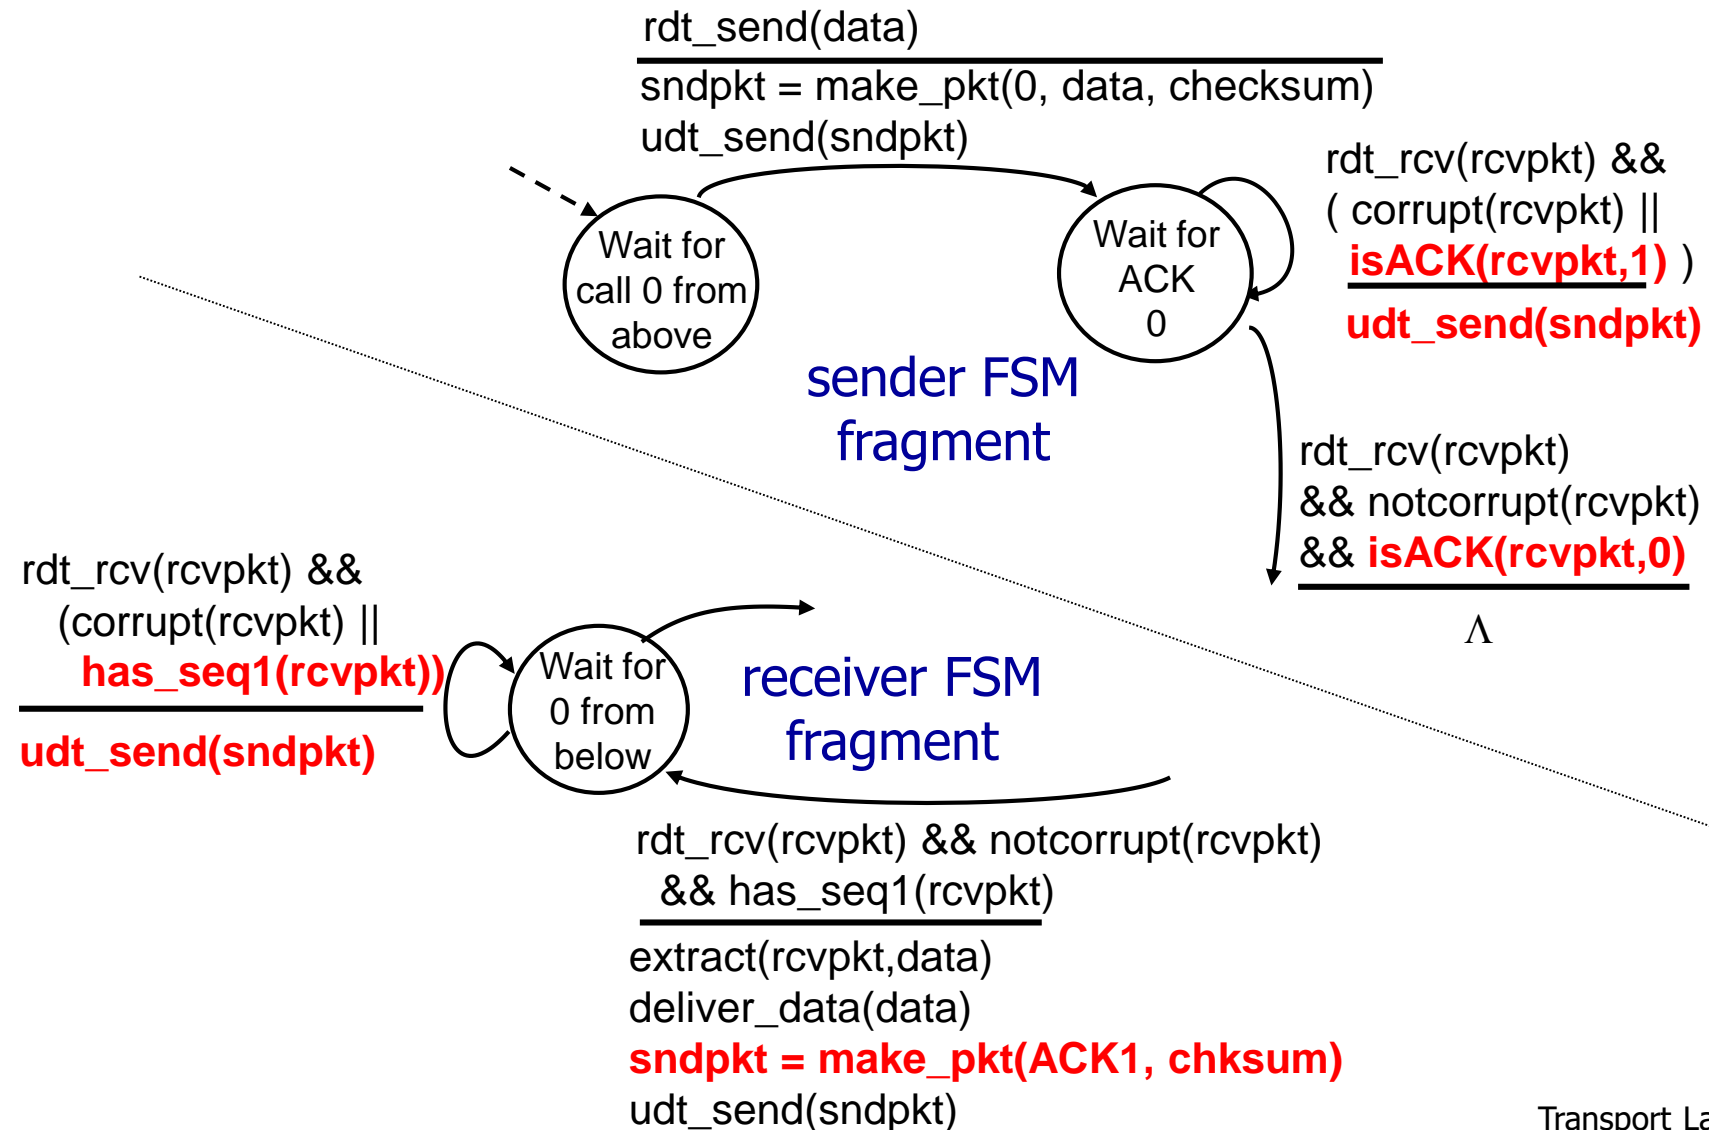

## rdt2.2: a NAK-free protocol

- ❖ same functionality as rdt2.1, using ACKs only
- ❖ instead of NAK, receiver sends ACK for last pkt received OK
  - receiver must *explicitly* include seq # of pkt being ACKed
- ❖ duplicate ACK at sender results in same action as NAK: *retransmit current pkt*

# rdt2.1: No NAK

# rdt2.2: sender, receiver fragments

# rdt3.0: channels with errors and loss

## new assumption:

underlying channel can also lose packets (data, ACKs)

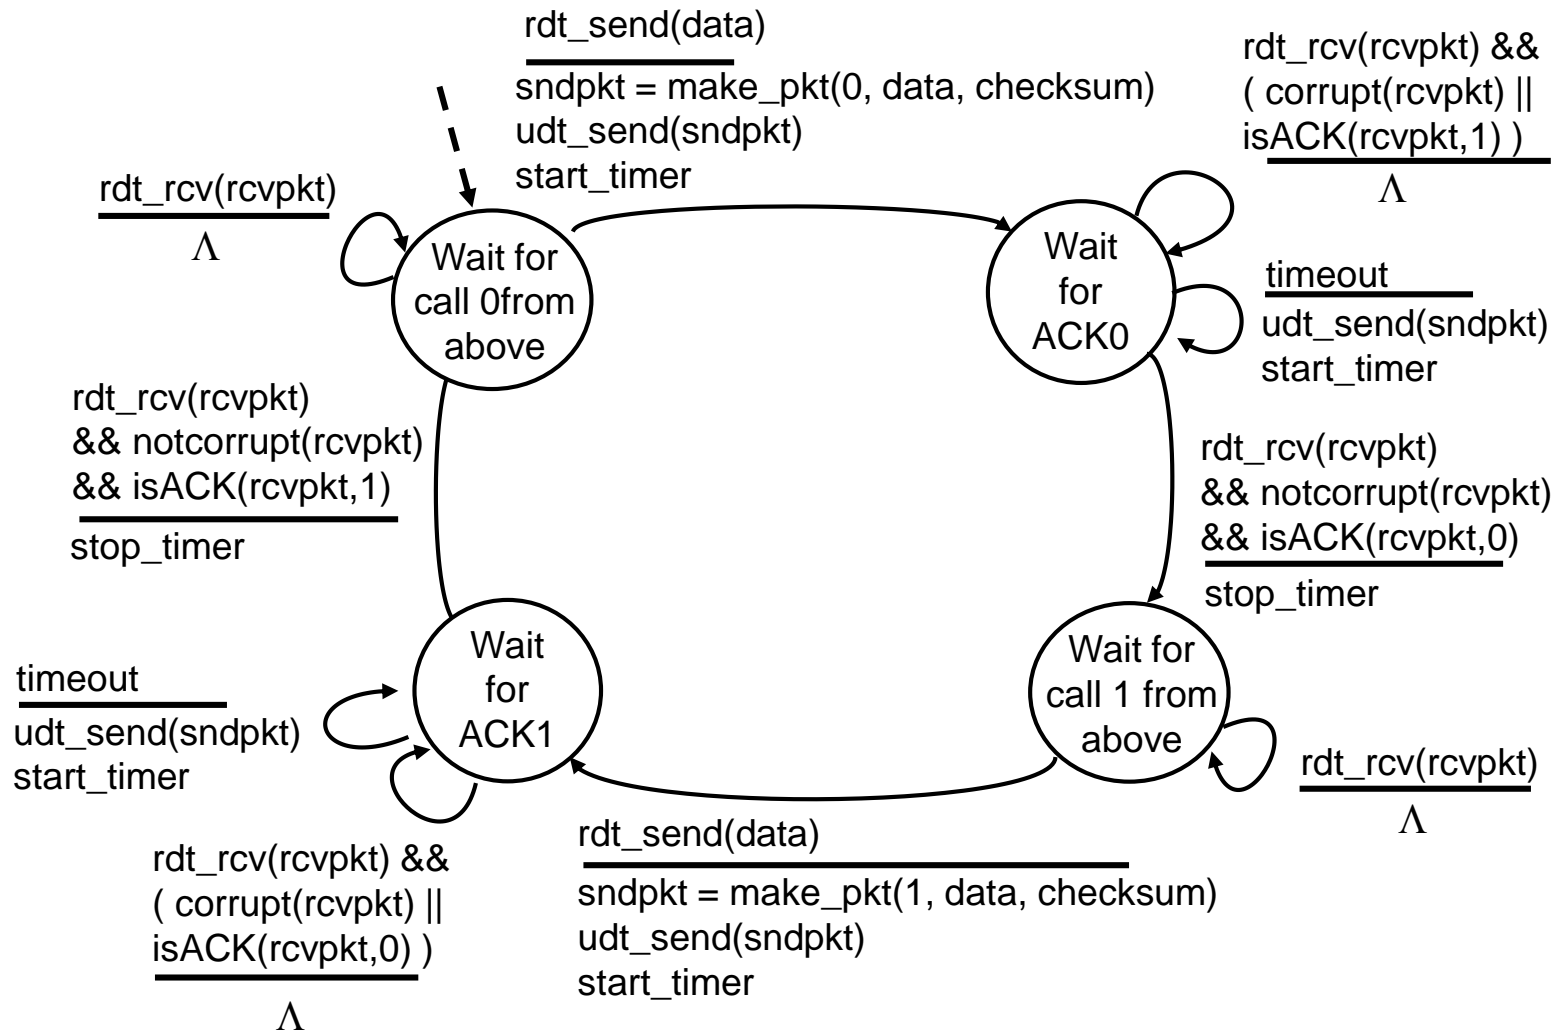

- checksum, seq. #, ACKs, retransmissions will be of help ... but not enough

approach: sender waits “reasonable” amount of time for ACK

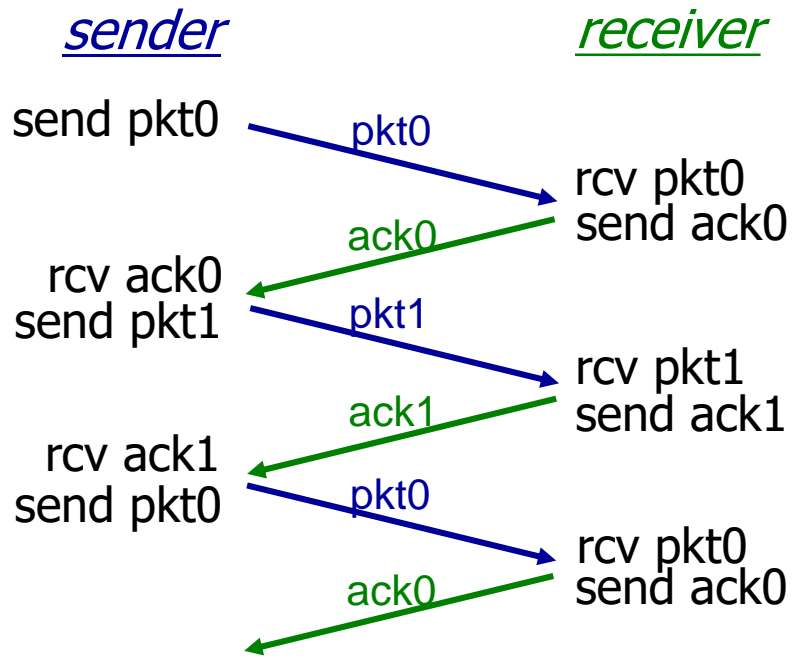

- ❖ retransmits if no ACK received in this time
- ❖ if pkt (or ACK) just delayed (not lost):
  - retransmission will be duplicate, but seq. #'s already handles this
  - receiver must specify seq # of pkt being ACKed
- ❖ requires countdown timer

Also known as alternating-bit protocol

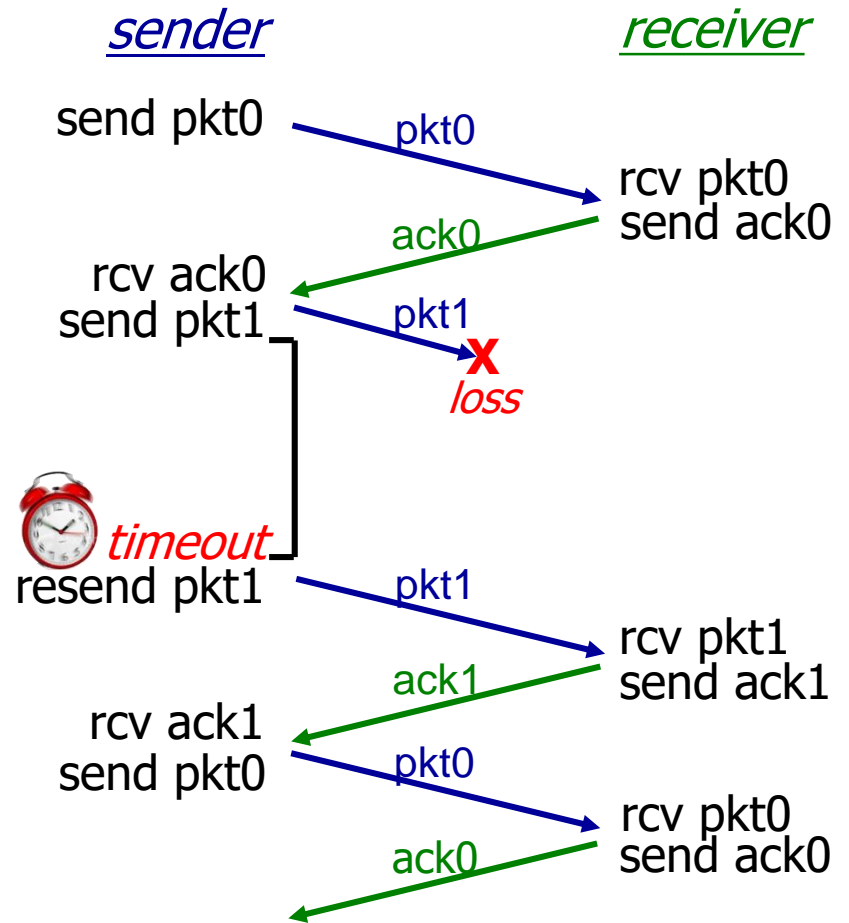

# rdt3.0 sender

# rdt3.0 in action

(a) no loss

(b) packet loss

# rdt3.0 in action

(c) ACK loss

(d) premature timeout/ delayed ACK

# Determining the Value of Timeout

- ❖ Must be as long as the round-trip time (RTT) between the sender and receiver
- ❖ Easy for point to point link
- ❖ Difficult to compute end to end; need to consider
  - buffering at intermediate routers
  - time needed to process packet at each hop
- ❖ Waiting for worst case maximum delay would degrade performance
  - Determined dynamically as in TCP

# Performance of rdt3.0

- ❖ rdt3.0 is correct, but performance stinks
- ❖ e.g.: 1 Gbps link, 15 ms prop. delay, 8000 bit packet:

$$D_{trans} = \frac{L}{R} = \frac{8000 \text{ bits}}{10^9 \text{ bits/sec}} = 8 \text{ microseconds}$$

- $U_{\text{sender}}$ : **utilization** – fraction of time sender busy sending

$$U_{\text{sender}} = \frac{L / R}{RTT + L / R} = \frac{.008}{30.008} = 0.00027$$

- if RTT=30 msec, 1KB pkt every 30 msec: 33kB/sec thruput over 1 Gbps link
- ❖ network protocol limits use of physical resources!

# rdt3.0: stop-and-wait operation

$$U_{\text{sender}} = \frac{L / R}{RTT + L / R} = \frac{.008}{30.008} = 0.00027$$

# Pipelined protocols

**pipelining:** sender allows multiple, “in-flight”, yet-to-be-acknowledged pkts

- range of sequence numbers must be increased
- buffering at sender and/or receiver

(a) a stop-and-wait protocol in operation

(b) a pipelined protocol in operation

# Pipelining: increased utilization

- ❖ two generic forms of pipelined protocols: *go-Back-N*, *selective repeat*

# Pipelined protocols: Go-back-N

- ❖ sender can have up to  $N$  unacked packets in pipeline
- ❖ receiver only sends *cumulative ack*
  - doesn't ack packet if there's a gap
- ❖ sender has timer for oldest unacked packet
  - when timer expires, retransmit *all* unacked packets

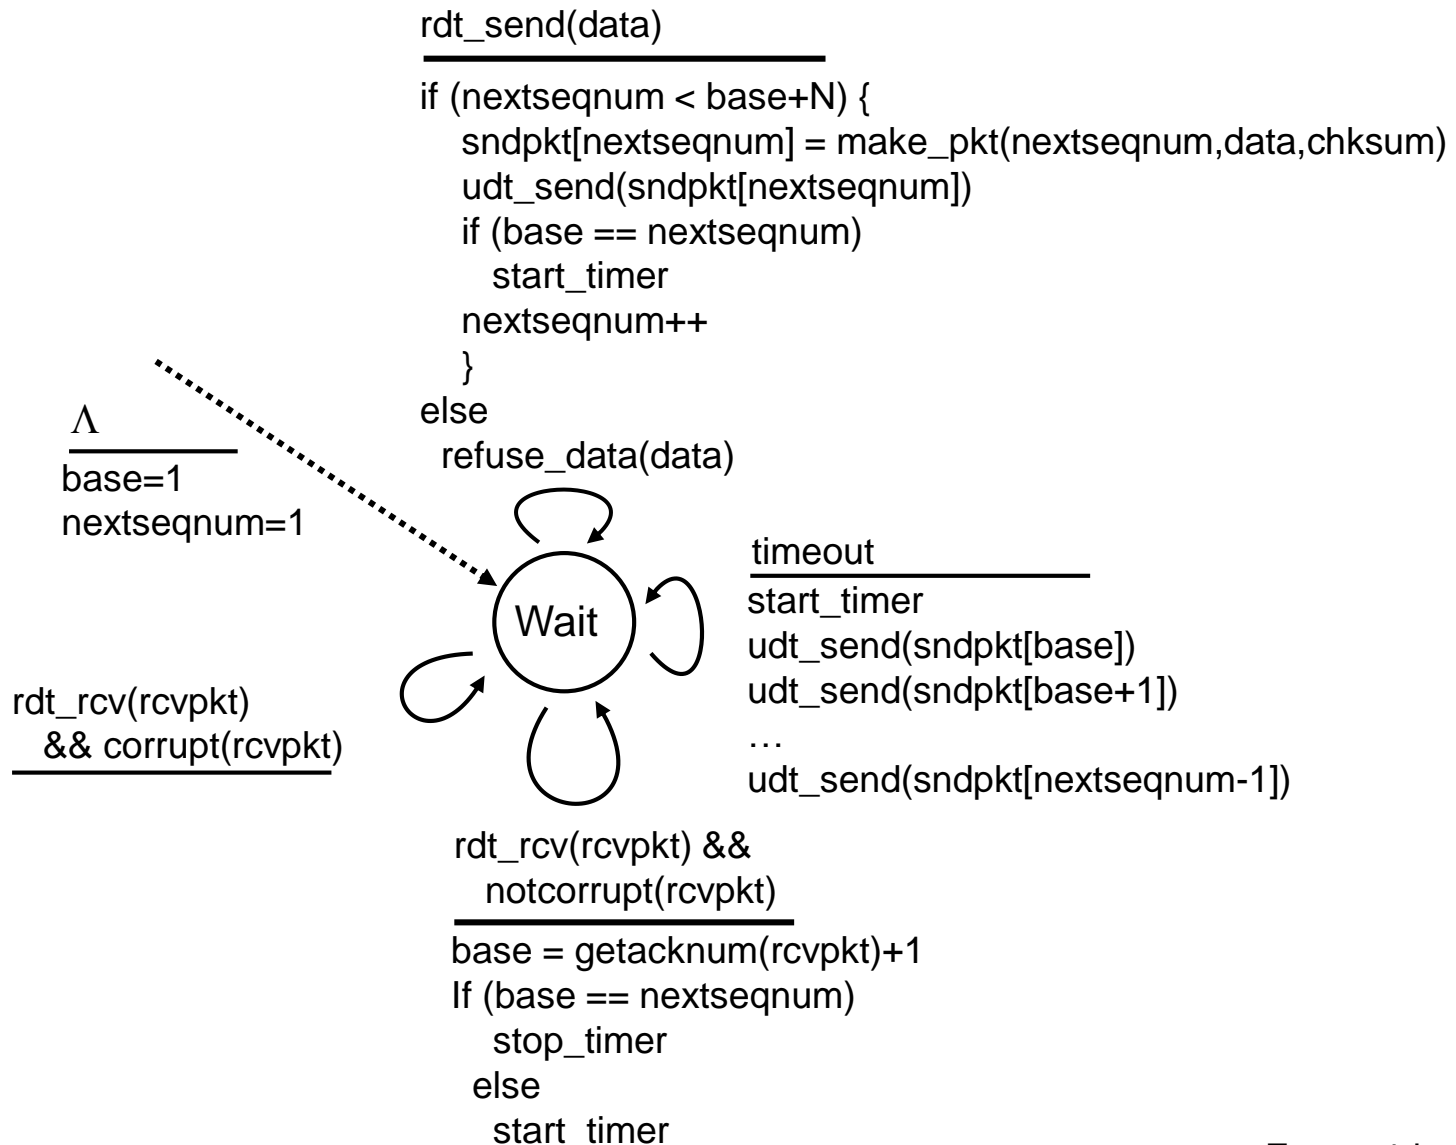

# Go-Back-N: sender

- ❖ k-bit seq # in pkt header
- ❖ “window” of up to N, consecutive unack’ed pkts allowed

- ❖ ACK(n): ACKs all pkts up to, including seq # n - “*cumulative ACK*”
  - may receive duplicate ACKs (see receiver)
- ❖ timer for oldest in-flight pkt
- ❖ *timeout(n)*: retransmit packet n and all higher seq # pkts in window

# GBN: sender extended FSM

# GBN: receiver extended FSM

ACK-only: always send ACK for correctly-received pkt with highest *in-order* seq #

- may generate duplicate ACKs
- need only remember **expectedseqnum**
- ❖ out-of-order pkt:
  - discard (don't buffer): *no receiver buffering!*
  - re-ACK pkt with highest in-order seq #

# GBN in action

sender window (N=4)

rcv pkt2, deliver, send ack2  
 rcv pkt3, deliver, send ack3  
 rcv pkt4, deliver, send ack4  
 rcv pkt5, deliver, send ack5

*X loss*

# Problems of GBN

- ❖ For a large window size, a single packet error causes retransmission of a large number of packets
- ❖ The pipeline becomes filled with unnecessary retransmissions
- ❖ Can be solved by
  - accepting out of order packets by the receiver
  - selective retransmission
    - Selective Repeat (SR) protocol

# Pipelined protocols: Selective repeat

- ❖ sender can have up to  $N$  unack'ed packets in pipeline
- ❖ receiver *individually* acknowledges all correctly received pkts
  - buffers pkts, as needed, for eventual in-order delivery to upper layer
- ❖ sender only resends pkts for which ACK not received
  - sender timer for each unACKed pkt
- ❖ sender window
  - $N$  consecutive seq #'s
  - limits seq #'s of sent, unACKed pkts

# Selective repeat: sender, receiver windows

# Selective repeat

## sender

### data from above:

- ❖ if next available seq # in window, send pkt

### timeout(n):

- ❖ resend pkt n, restart timer

### ACK(n) in [sendbase, sendbase+N]:

- ❖ mark pkt n as received
- ❖ if n smallest unACKed pkt, advance window base to next unACKed seq #

## receiver

### pkt n in [rcvbase, rcvbase+N-1]

- ❖ send ACK(n)
- ❖ out-of-order: buffer
- ❖ in-order: deliver (also deliver buffered, in-order pkts), advance window to next not-yet-received pkt

### pkt n in [rcvbase-N, rcvbase-1]

- ❖ ACK(n)

### otherwise:

- ❖ ignore

# Selective repeat in action

send ack3

receive pkt4, buffer,  
send ack4

receive pkt5, buffer,  
send ack5

rcv pkt2; deliver pkt2,  
pkt3, pkt4, pkt5; send ack2

*Q: what happens when ack2 arrives?*

# Problems with Finite Sequence No.

example:

- ❖ seq #'s: 0, 1, 2, 3
- ❖ window size=3
- ❖ receiver sees no difference in two scenarios!
- ❖ duplicate data accepted as new in (b)

Q: what relationship between seq # size and window size to avoid problem in (b)?

Q: What should the relation in GBN?

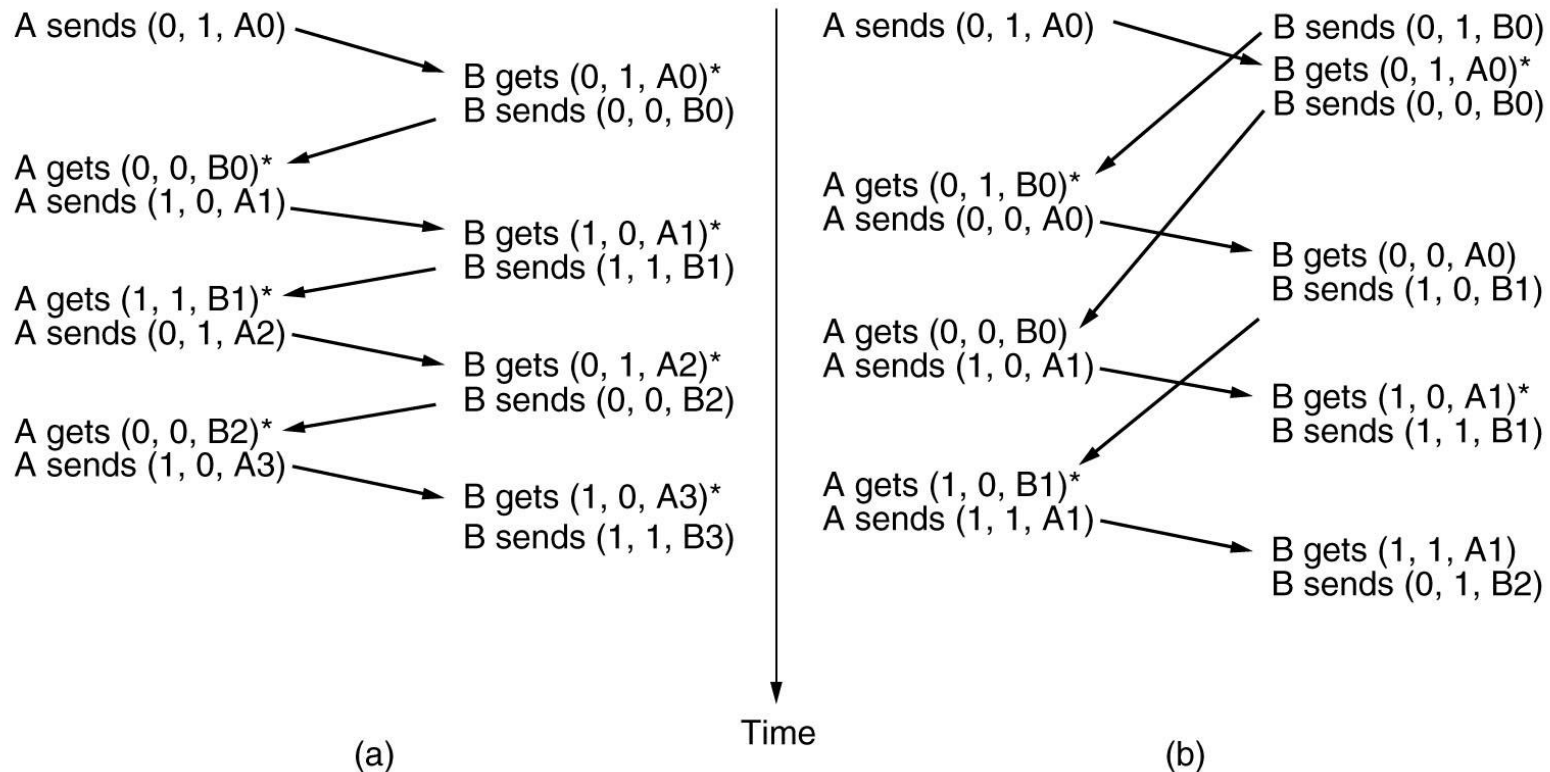

receiver can't see sender side.  
receiver behavior identical in both cases!  
*something's (very) wrong!*

# Bi-directional Transfer

- ❖ Send ack in the same frame for data
- ❖ Known as **Piggybacking**

# Delayed Duplicate Problem

- ❖ Old copies of a packet may appear at the sender or receiver
- ❖ Since sequence numbers wrap around, care must be taken to guard against such duplicate packet
  - Do not use a sequence number, until all the earlier packets with the same sequence number have died out.
  - TCP extension for high speed network assumes maximum packet lifetime of approx. three minutes

# Sliding Window at Link Layer: HDLC

## HDLC Frame Structure

### Information (I) frame format

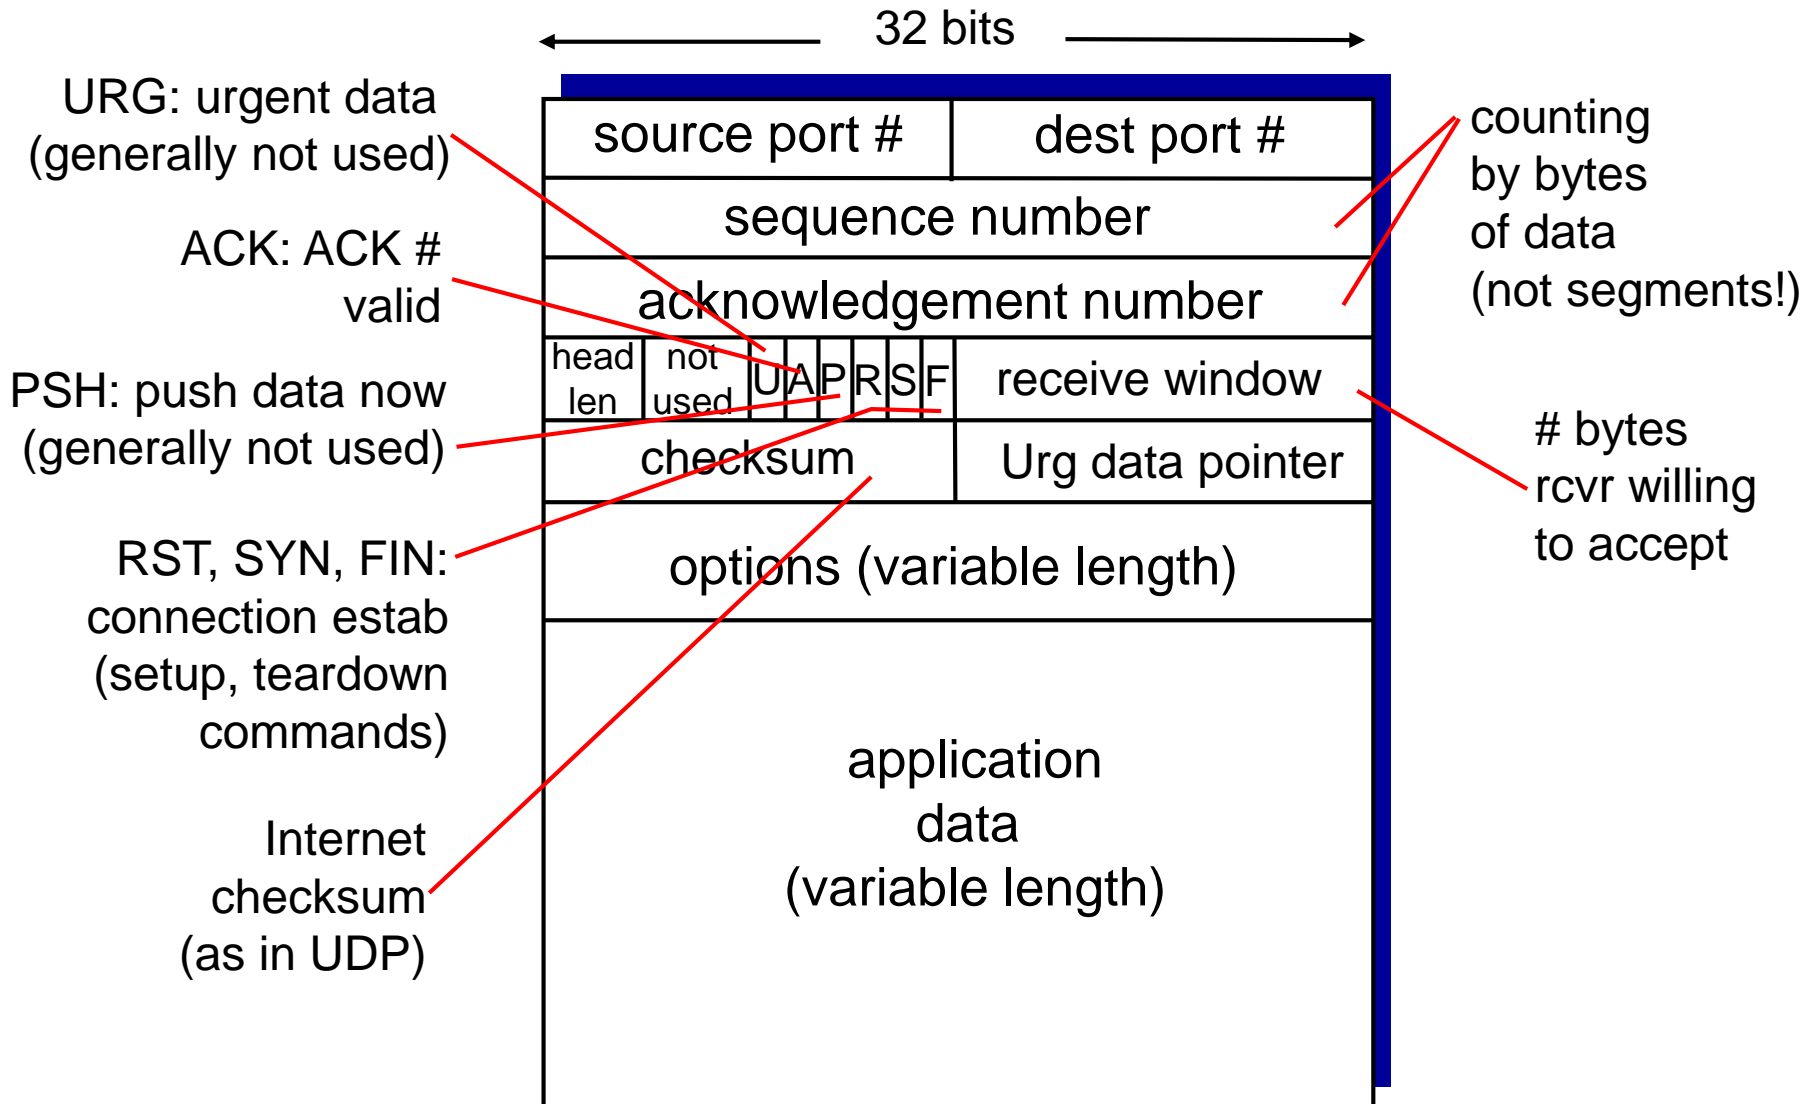

### Supervisory (S) frame format

### Unnumbered (U) frame format

# Sliding Window at Transport Layer: TCP

TCP Header

# Sliding Window in TCP (2)

## sequence numbers:

- byte stream “number” of first byte in segment’s data

## acknowledgements:

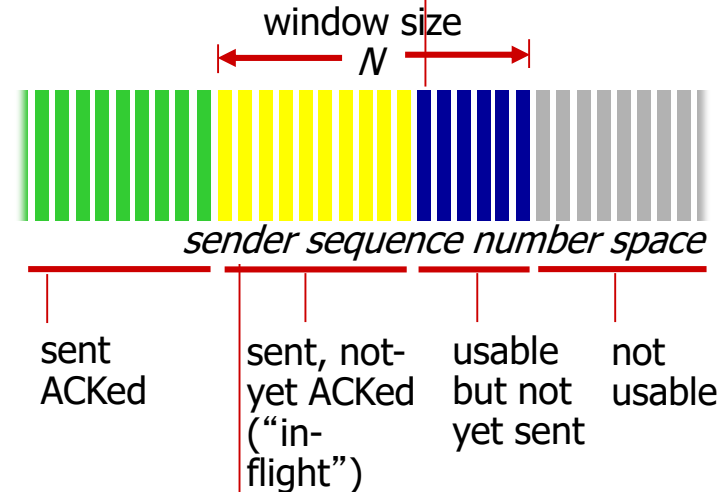

- seq # of next byte expected from other side
- cumulative ACK

**Q:** how receiver handles out-of-order segments

- A:** TCP spec doesn’t say,  
- up to implementor

outgoing segment from sender

source port #	dest port #
sequence number	
acknowledgement number	
	rwnd
checksum	urg pointer

incoming segment to sender

source port #	dest port #
sequence number	
acknowledgement number	
	A
checksum	urg pointer

# TCP round trip time, timeout

- ❖ **timeout interval:** **EstimatedRTT** plus “safety margin”
  - large variation in **EstimatedRTT** → larger safety margin
- ❖ estimate **SampleRTT** deviation from **EstimatedRTT**:

$$\text{DevRTT} = (1-\beta) * \text{DevRTT} + \beta * |\text{SampleRTT} - \text{EstimatedRTT}|$$

(typically,  $\beta = 0.25$ )

$$\text{TimeoutInterval} = \text{EstimatedRTT} + 4 * \text{DevRTT}$$

↑  
estimated RTT

↑  
“safety margin”

# TCP ACK generation [RFC 1122, RFC 2581]

<i>event at receiver</i>	<i>TCP receiver action</i>
arrival of in-order segment with expected seq #. All data up to expected seq # already ACKed	delayed ACK. Wait up to 500ms for next segment. If no next segment, send ACK
arrival of in-order segment with expected seq #. One other segment has ACK pending	immediately send single cumulative ACK, ACKing both in-order segments
arrival of out-of-order segment higher-than-expect seq. # . Gap detected	immediately send <i>duplicate ACK</i> , indicating seq. # of next expected byte
arrival of segment that partially or completely fills gap	immediate send ACK, provided that segment starts at lower end of gap

# TCP fast retransmit

- ❖ time-out period often relatively long:
  - long delay before resending lost packet
- ❖ detect lost segments via duplicate ACKs.
  - sender often sends many segments back-to-back
  - if segment is lost, there will likely be many duplicate ACKs.

## *TCP fast retransmit*

if sender receives 3 ACKs for same data (“triple duplicate ACKs”), resend unacked segment with smallest seq #

- likely that unacked segment lost, so don't wait for timeout

# TCP fast retransmit
